

Optimization in numbers

Calculating the value of monetizing flexibility on the imbalance market

Improved transparency on imbalance prices and flexibility within your operation can create additional revenues.

Check for example this case based on the 2017 imbalance market NL:

Statistics (2017 NL)

8 % of the time high imbalance prices (>2x day-ahead price)

Average day-ahead price:
37 €/MWh

Average imbalance price in high periods:
184 €/MWh

By capturing 5 minutes of every high imbalance price PTE, additional revenues could have been created*:

For example, in 2017 a medium sized plant with 10 MW of flexibility could have created **power revenues of**

€ 430,000

**234
MWh /year**

Potential revenue:

€ 43,000 /year
for every MW of flex

*Numbers for each MW of flexibility
